Tampons and wound dressings are available today only with antiseptic (antimicrobial) agents. The agents are synthetic chemicals and have no effect on wound healing and stop bleeding. Drugs which are used to stop bleeding are caused by any reason are called hemostatic drugs. Astringent ingredients, such as adrenaline (vasoconstrictor), had influence and help to stop bleeding. This new product that we will obtain under this project derived from herbal ephedrine (stopping bleeding), John's wort oil (wound healing and antiseptic), Clay, (wound healing) should provide on ingredients. These important features which is not found in the classic wound bands, provide to be very different and effective product in the field of wound tape and wound pads.
