Abstract
In Turkey, the mining activities (especially marble quarries) causes environmental and visual impacts. Therefore, a marble quarry sector is considered problematic due to drastic changes in the natural landscape by the public. Isparta province has many problems due to increasing activities of the marble quarries. In actually, these problems in Isparta province are parallel to with problems in National dimension. In this context, about landscape rehabilitation of the marble quarries in Isparta, the current situation and problems have been identified with SWOT analysis by experts from the different disciplines.

In this study, the main problem of the landscape rehabilitation of marble quarries operating have been identified as in the legal, institutional organization, the permitting process, residuals, design, implementation and monitoring. And also integrated action plan has been proposed for the future for Isparta province. As a result, the current problems about landscape or the nature rehabilitation of damaged or destroyed landscapes should be solved by holistic, participatory and environmentalist approaches in national dimension.
