One of the most important steps is undoubtedly the levelling process in recultivation. A topographically smooth surface is very advantageous for recultivation. Blasting method is a good solution for this process. In this context, it is very important to design the delay time in blasting. Other techniques may also be used with blasting. In this study, good, easy, and affordable way to make levelling on how to design delay time in blasting is explained with examples. Possible blasting techniques for solution are also discussed.
