In the literature review, no study has been done on the attitudes of children between 4-6 years to animals in our country. The aim of this research is to develop a scale that will measure the attitudes of the children of 4-6 years to animals and to contribute to fill this gap in the literature.

During the scale development process, a pool of substances was created with three specialists from the Department of Preschool Education, Classroom Education and Measurement and Evaluation in Education. Seven specialists from the Faculty of Education, Preschool Education, Classroom Education and Education Measurement and Evaluation and Department of Veterinary Medicine were presented to receive expert opinions. The scale re-evaluated in line with the opinions of the experts was implemented with three parents aged 4-6 years and reassessed after the parents’ views. Afterwards, the scale was sent to 600 parents whose children aged between 4 and 6 years in various kindergartens in Isparta for pilot application. Pilot application will be finalized after the scale validity and reliability studies are done.
