As a result of the increasing participation of public hospitals in the sector, increasing quality in health service delivery increased the importance of the concept of patient safety. Any element that threatens the safety of patients during the service provided can lead to health problems that cannot be compensated for human health or loss of human life. In this respect, patient safety perceptions of health workers and patient safety culture created in health institutions affect service quality and become more important for human health. The study was conducted to evaluate the perception of health safety of patients and their relationship with demographic data. It is a practical and descriptive study in terms of presenting the current situation of patient safety culture. According to the findings of the study, it was determined that the arithmetic means of the patient safety culture of the health workers were above the medium level.
