ABSTRACT
Urban trees and forests are very important and inevitable natural materials by providing aesthetics and functional benefits for urban life and urban people. In this study, the concept and frame of urban forestry was studied. In this connection, studies of urban forestry activities were examined and urban trees used in Isparta city were determined. In this connection, some solutions were proposed for revealed current problems concerning the topic. According to results of the study, some serious problems connecting with the selection of proper tree species were observed and the design to be used by urban forestry project, including proper maintenance and restoration and insufficient personnel and budget facilities were determined. In addition, studies about urban forestry should be realized in sustainable urban forestry planning and management for their purposes according to scientific and technical principles of the urban open green areas systems.
