Located at the heart of the Lake District of the Mediterranean Region, Isparta has a very significant potential in terms of historical, archaeological and cultural values. It makes an effort to conserve its original qualities with its historical fabric consisting of churches, mosques, khans, shops, traditional residents and civil architectural buildings. However, on account of the rise in the population and close location of the historical fabric to the city center, traditional fabric faces the danger of nonexistence. It is an important problem for historical fabric that the new urban developments occur irregularly and without any identity by neglecting the fabric. Researching the issues about the conservation of the historical fabric of Isparta city with contemporary methods, determining the qualities and the problems of the historical registered civil architectural buildings are very significant. In the extent of this study, conservation problems of civil architectural buildings are examined in detail and make some proposals for accelerating the conservation applications in order to provide the sustainability to these buildings which faces the danger of losing the qualities of their historical period.
